University of Notre Dame ¹

NOAA/NCEP/NOS ²

Great Lakes Environmental Research Lab³

**1st International Workshop on Waves,
Storm Surges and Coastal Hazards**

September 2017

Western Alaska LCC

- 1 Model Description
- 2 Validation of Tides and Summer Storms
- 3 Sea Ice Implementation to Circulation Modelling
- 4 Modelling Storm Surge in the Presence of Ice Coverage
 - November 2011
 - February 2011
 - January 2017
- 5 Proposed

- 1 Model Description
- 2 Validation of Tides and Summer Storms
- 3 Sea Ice Implementation to Circulation Modelling
- 4 Modelling Storm Surge in the Presence of Ice Coverage
 - November 2011
 - February 2011
 - January 2017
- 5 Proposed

Grid Development

4,061,175 nodes, 5 km to 25 m coastal resolution

Outline

- 1 Model Description
- 2 Validation of Tides and Summer Storms
- 3 Sea Ice Implementation to Circulation Modelling
- 4 Modelling Storm Surge in the Presence of Ice Coverage
 - November 2011
 - February 2011
 - January 2017
- 5 Proposed

M_2 Amplitude

M_2 Validation

M_2 Amplitude

M_2 Amplitude

- Good performance everywhere but Kuskokwim River
- Performance greatly improved in Aleutians with f_l

M_2 Phase

M_2 Phase Validation

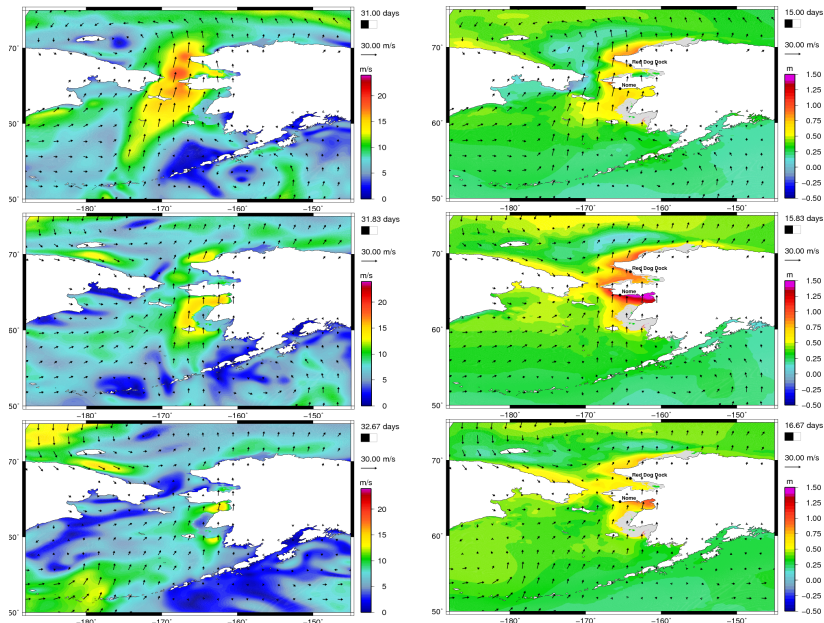

- Despite complexity, only small highly localized errors

Atmospheric and Sea Ice Forcing

- National Centers for Environmental Predictions Climate Forecast System Reanalysis (CFSv2) [3].
- Hourly wind speeds at a 10 m height with a horizontal resolution of 0.205 degrees by 0.204 degrees
- Hourly atmospheric pressure at a resolution of 0.5 degrees.
- Sea ice from NCEP Automated Sea Ice Concentration Analysis 0.08333 degrees satellite based

Summer Storm Validation - August 2012

Stations

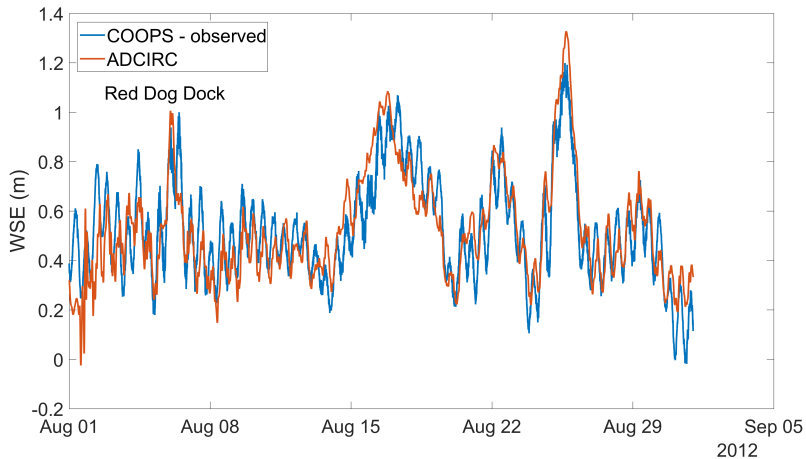

August 2012 Validation

Nome

August 2012 Validation

Red Dog Dock

Outline

- 1 Model Description
- 2 Validation of Tides and Summer Storms
- 3 Sea Ice Implementation to Circulation Modelling
- 4 Modelling Storm Surge in the Presence of Ice Coverage
 - November 2011
 - February 2011
 - January 2017
- 5 Proposed

Investigated Implementation to ADCIRC

$$C_D = (AF)C_{D,is} + (1 - AF)C_{D,w} + C_{D,if} \quad (1)$$

$C_{D,is}$ = ice skin drag = 0.0015

$C_{D,w}$ = Garratt drag law

$C_{D,if}$ = ice form drag

$C_{D,if}(0) = 0, C_{D,if}(1) = 0$

$C_{D,if}(.5) = C_{D,if,max} = .0025$

- Decompose the flux coefficient into contributions which are a function of both wind speed and ice coverage
- Area weighted approach [5, 1, 2]
- Considers both the form and skin drag over ice floes
- Form drag determined by number of ice face/obstacles

New Ice Parameterization - C_d

New Ice Parameterization - % Change

New Ice Parameterization - Assumptions and Limitations

- Only considers atmospheric side
 - Assumes proportional relationship between the wind speed and the ice drift-ocean current differential
 - Assumes proportional relationship between air-ice drag and ice-ocean drag
 - Assumes no direction change in ice drift wrt wind speed
- Doesn't consider fast ice
- Data limitations
 - Low resolution temporally (only daily evolution of the ice field)
 - Missing features of the ice (only area fraction)

Outline

- 1 Model Description
- 2 Validation of Tides and Summer Storms
- 3 Sea Ice Implementation to Circulation Modelling
- 4 Modelling Storm Surge in the Presence of Ice Coverage
 - November 2011
 - February 2011
 - January 2017
- 5 Proposed

Outline

- 1 Model Description
- 2 Validation of Tides and Summer Storms
- 3 Sea Ice Implementation to Circulation Modelling
- 4 Modelling Storm Surge in the Presence of Ice Coverage
 - November 2011
 - February 2011
 - January 2017
- 5 Proposed

Proposed - Wind Wave Model

- Typically, ADCIRC is coupled to the Simulating WAVes Nearshore (SWAN) model
 - Tight coupling
 - Run simultaneously on the same grid
 - **NO ICE PHYSICS**
- WAVEWATCH III spectral wave model
 - Incorporated recent ice physics developed as part of an Office of Naval Research (ONR) Directed Research Initiative (DRI)
 - Four different options for wave dissipation due to ice that covers a variety of ice conditions. 3 are physics based, one empirical
 - Allows for two wave scattering and dispersion due to ice as well as an option for ice breakup due to waves
 - Earth System Modelling Framework (ESMF) provides structure and communication paradigm for coupling to be completed

Proposed - Sea Ice Model

- Still significant uncertainty in air-sea-ice interaction with respect to storm surge
- General limitations on ice product (CFSv2/NCEP)
- Limited to area fraction and thickness
- The Los Alamos Sea Ice Model (CICE)
 - Computes a number of factors including ice floe size, ridge height, and the presence of melt ponds
 - Includes a well developed description of the drag coefficient on both the atmosphere-ice and ice-ocean interfaces [4]
 - Computes ice drift speeds

$$\tau_{i-o} = \rho_w C_{d,i-o} |u_i - u_o| (u_i - u_o) \quad (2)$$

Total ocean stress

$$\tau_{ocn} = (1 - AF)\tau_{a-o} + (AF)\tau_{i-o} \quad (3)$$
