Southern Ocean Challenges for Navy Ships

Search & Rescue Region

- NZ SAR Region = 30M km²
- From South Pole north to Kiribati group
- From mid Tasman Sea east to Cook Islands
- 844 emergencies (EPIRBs and maydays) in NZ SAR area May 2011 – 2012

HMNZS Otago, May 2016

Existing Information Inadequate

Hogben, ., N. (Neil), N. M. C. Dacunha, G. F. Olliver, and B. M. T. Ltd (1986), Global wave statistics, London, c1986

Requirements for new ship design

- Establish an observation program
- Quantify wave climate
- Update existing joint probability Hs/Tp statistics
- Specify historical wave spectra

Outline

- Background
- Observing program
- Modelling Experiments
- Wave Atlas

Existing Information Inadequate

First Deployment

- Deployed 8th of February 2018
- Triaxys directional buoy
- Deployed from the HMS Otago
- 147m depth
- Transmitting full spectra at 3 hourly intervals

Lagrangian collection phase

- Buoy broke its mooring on 27th July 2017
- Continued to transmit data until August 2018
- Has not yet been recovered

Second Deployment

- Deployed 2nd of March 2018
- Triaxys directional buoy
- Deployed from the HMS Wellington
- 147m depth
- Transmitting full spectra at 3 hourly intervals
- Commitment to service on an annual basis coinciding with NZDF conservations support in subantactic island group

WAVEWATCH III, ST4, CFSR Forcing

Southern Ocean Currents

The Antarctic Circumpolar Current (ACC) is the largest ocean current (>100 Sv).

The ACC produces changes in the waves because of both refraction and reduction of relative wind speed

Currents - Hindcast Results

Henrique, R; Durrant, T; and Babanin, A - An assessment of the impact of surface currents on wave modeling in the Southern Ocean - Ocean Dynamics 2018

Current Effects

CFSR wind, ice and current forcing

 $-0.20 \hbox{-} 0.16 \hbox{-} 0.12 \hbox{-} 0.08 \hbox{-} 0.04 0.00 0.04 0.08 0.12 0.16 0.20$

Propagation effects only

 $-0.20 \hbox{-} 0.16 \hbox{-} 0.12 \hbox{-} 0.08 \hbox{-} 0.04 0.00 0.04 0.08 0.12 0.16 0.20$

Propagation and relative wind effects

- Comparison between ERA5 and CFSR as forcings
- Testing of different ice concentration thresholds
- Inclusion of icebergs
- Effect of ocean currents: CFSR, HYCOM, GLORYS

Model Grids

- Global grid
 0.50x0.50 deg.
- Regional grid
 0.25x0.20 deg.
- Regional grid
 0.10x0.10 deg.

Southern Ocean Wave Atlas

- Timeseries, tp/hs joint probablility statistics, rose plots etc available at metoceanview.com
- Contact us for spectra

Further work

• Glorys currents only cover up until 2017 which didn't cover the observations period - there is much more work that can be done with these observations - more work needed

Conclusions

- Increased availability of wave observations in the Southern Hemisphere.
- Significantly better wave results with ERA5 forcings than with CFSR forcings.
- Ocean currents have a positive effect, reduces Southern Ocean positive bias.
- GLORYS currents give better results than CFSR and HYCOM for ERA5 forced wave hindcasts

Ongoing Deployments

Buoy loading onto the HMS Canterbury on 9th of November, 2019

Tom Durrant t.durrant@oceanum.science
