The missing piece

Extreme wind-waves

Past uncertainties:

- Wave model
- Atmospheric model
- Observations
- Statistical

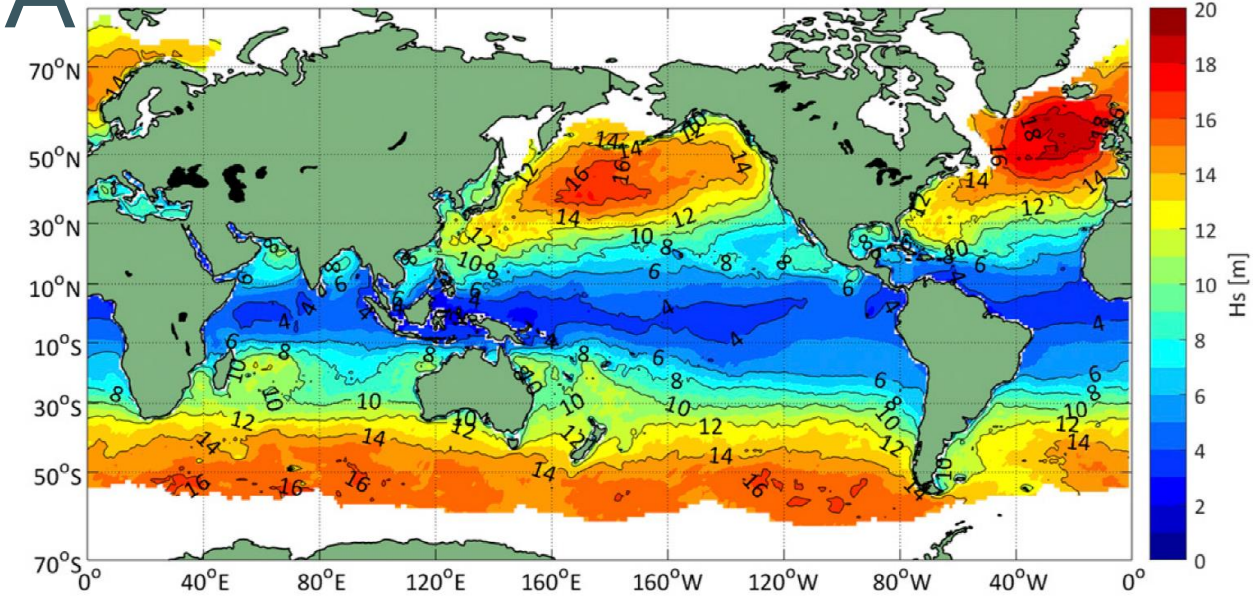
Future uncertainties:

- Emissions scenarios
- GCMs

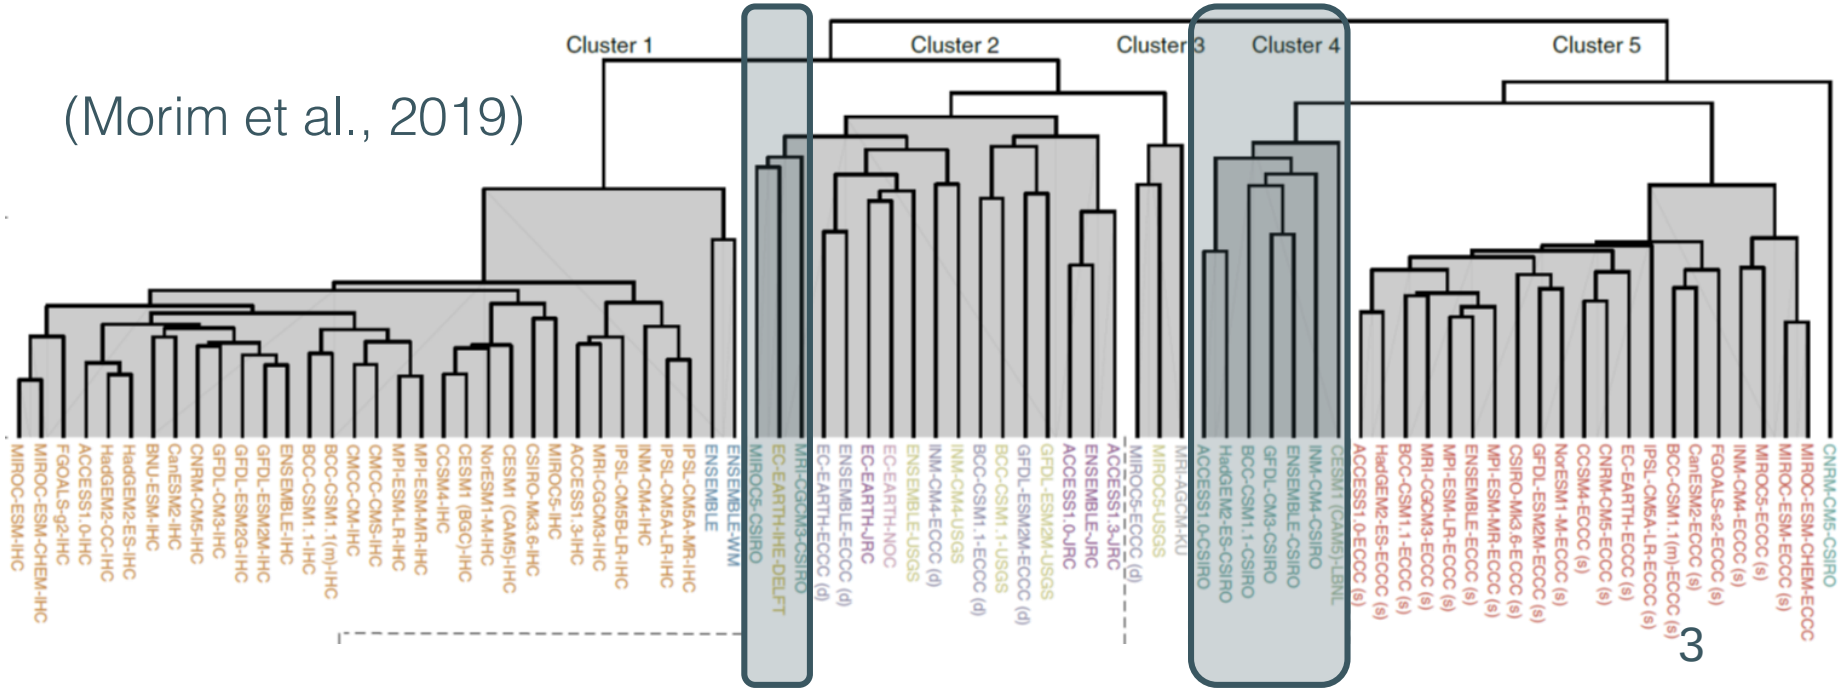
Ensemble approach to EVA

(Lorenz, 1965; Molteni et al., 1996)

(Breivik et al., 2013, 2014; Meucci et al., 2018)



(Morim et al., 2019)



WWIII (v3.14) 6-hourly datasets forced using CMIP5 GCM surface winds

(Hemer et al., 2016)

Dataset

WWIII (v3.14) 6-hourly datasets forced using CMIP5 GCM surface winds

(Hemer et al., 2016)

	CMIP	ATM	WAVE		Period		
	phase	lon x lat [˚]	lon x lat [˚]	Δt			
ACCESS1.0	5	1.88 x 1.25	1.0 x 1.0	6h	1979-2005	2081-2100	
BCC-CSM1.1	5	2.8 x 2.8	1.0 x 1.0	6h	1979-2005	2081-2100	RCP4.5
GFDL-CM3	5	2.5 x 2.0	1.0 x 1.0	6h	1979-2005	2081-2100	
HadGEM2-ES	5	1.88 x 1.25	1.0 x 1.0	6h	1979-2005	2081-2100	
INMCM4	5	2.0 x 1.25	1.0 x 1.0	6h	1979-2005	2081-2100	RCP8.5
MIROC5	5	1.4 x 1.4	1.0 x 1.0	6h	1979-2005	2081-2100	
MRI-CGCM3	5	1.1 x 1.1	1.0 x 1.0	6h	1979-2005	2081-2100	

Selection of extremes

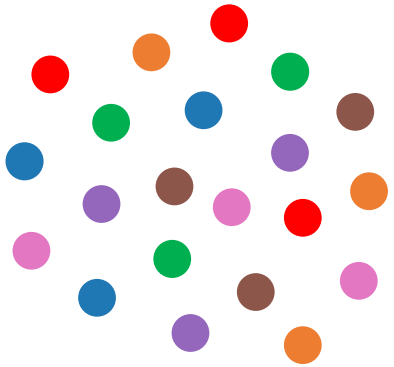
(Lopatoukhin et al., 2000)

peaks over 90th percentile threshold for each model -- 48h storm independence

- ACCESS1.0
- BCC-CSM1.1
- GFDL-CM3
- HadGEM2-ES
- INMCM4
- MIROC5
- MRI-CGCM3

$$Z_m = \frac{H_{s,m} - \mu_m^{hist}}{\sigma_m^{hist}}$$

(Aarnes et al., 2017)



1000 highest peaks

Representative time interval

(Breivik et al., 2013, 2014)

Historical dataset 1979-2005:

T_{eq} = 27 years · 365 · 4 hindcasts a day · 6h · 7 GCMs = 189 years

Future projection dataset 2081-2100:

T_{eq} = 20 years · 365 · 4 hindcasts a day · 6h · 7 GCMs = 140 years

Changes along global coastlines

Percentage of changes in H_s^{100}

	RCP4.5		RCP8.5	
(% change)	Coastline length (km)	Coastline length (%)	Coastline length (km)	Coastline length (%)
-20% to -15%	9,643	0.89	7,399	0.69
-15% to -10%	13,130	1.22	25,281	2.34
-10% to -5%	69,208	6.42	120,625	11.18
-5% to 0%	277,810	25.76	285,227	26.45
0% to 5%	499,537	46.32	365,741	33.91
5% to 10%	168,420	15.62	182,163	16.89
10% to 15%	33,053	3.06	68,087	6.31
15% to 20%	7,737	0.72	24,015	2.23

DIVA dataset locations

ΔH_s^{100} at the closest offshore grid point

Limitations

- Stationarity
- Inhomogeneous datasets
- Tropical Cyclones still not correctly reproduced by GCMs
- Possible biases introduced by differently distributed datasets

Potential

- Results are consistent with previous studies
  (Hemer et al. 2013; Wang et al. 2014; Aarnes et al. 2017; Morim et al. 2019)
- Inter models low correlation guarantees independence
- Possibility to synthesize an equivalent time series of duration longer than the simulation period
- Increased dataset reduces confidence intervals

At what point are we?

- Higher resolutions are needed
- Ensemble approach to TC areas with increasing model resolution
- Still many uncertainties are characterizing observations of extremes
- Improved GCMs and additional models may allow use of Direct Return level Estimates
- Do GCMs ensemble models for future projections exist?
