The Mediterranean is a **climate change hotspot** and one of the most **densely populated** coastal regions in the world.

**Reliable scenarios** are needed to design **effective adaptation** and **risk reduction** strategies.

Using a **large ensemble** allows us to quantify internal variability and uncertainties in **future projections**.

Extreme storm surge events can cause **severe impacts** on coastal communities, infrastructure, and cultural heritage.

**Rapallo,  
Ligurian Sea,  
29 October 2018**

- **Modelling:**

- Set up a **high spatial and temporal resolution** storm surge model across the **entire Mediterranean basin** using **Delft3D software**.
- Develop a **hindcast dataset (45 years, 1979-2023)**.
- Develop a large ensemble of future storm surge projections up to the **end of the XXI century**, considering atmospheric forcing from **17 GCMs-RCMs** combinations, based on the **RCP8.5 climate change scenario**.

Modelling of hydrodynamic processes through the resolution of the Navier Stokes equations for an incompressible fluid, under the shallow water and the Boussinesq assumptions.

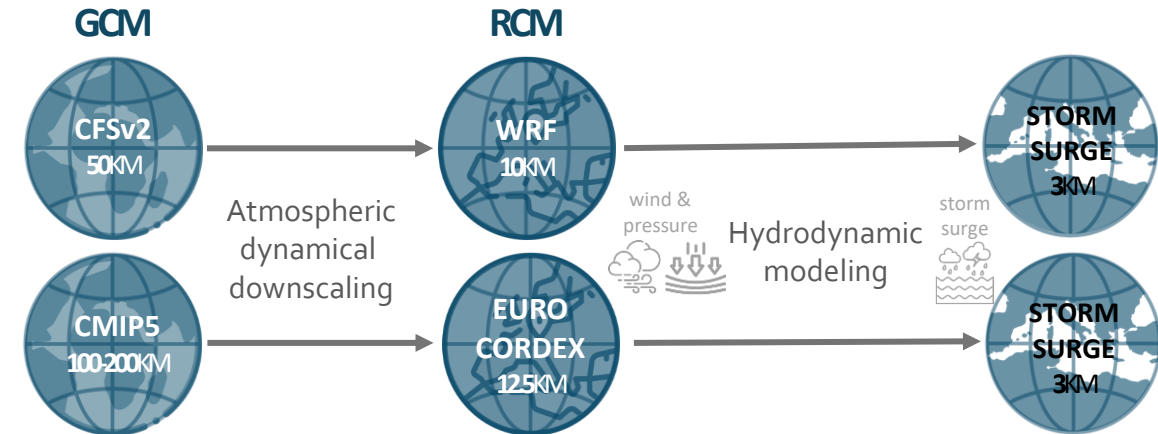

- **Data analysis:**

- Analyses on **Extreme Surge Levels** and **variation in Return Periods**.

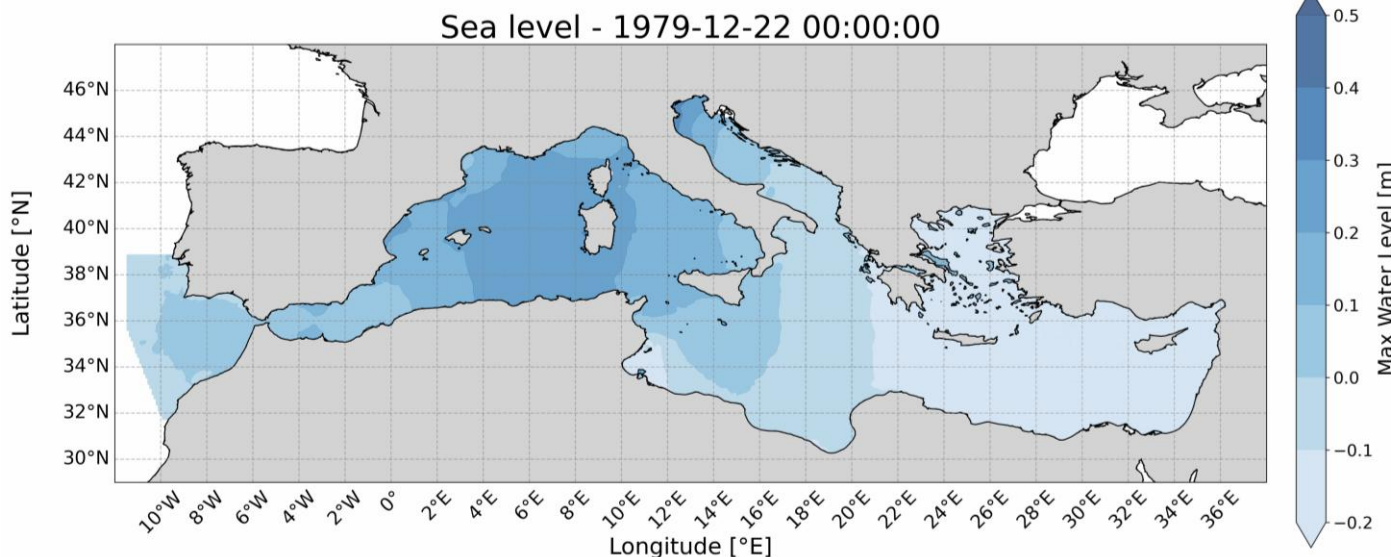

# The Model

- Structured **grid at 3km resolution** (more than 308'000 grid points).
- Atmospheric forcing at:**
  - 10 km** spatial resolution – **1 hour** temporal resolution (**HINDCAST**).
  - 12.5 km** spatial resolution – **3 hours** temporal resolutions (**PROJECTIONS**).
- Specific parametrization for the Wind Drag Coefficient.
- Single depth-averaged layer** in the vertical direction.
- Inverse Barometer Effect** at the Atlantic Ocean open boundary.

## 45 years dataset (1979-2023)

- **Hindcast Validation:**

- **Tide gauges:** 51 stations from GESLA3 dataset (hourly resolution).
- **Satellite data:** daily averages from CMEMS (available since 1993).

## 17 GCM-RCMs combinations:

GCM / RCM	CCLM4-8-17	RCA4	HIRHAM5	COSMO
CCCma-CanESM2	✓			
MIROC-MIROC5	✓			
CNRM-CERFACS-CNRM-CM5		✓	✓	
IPSL-IPSL-CM5A-MR		✓	✓	
MOHC-HadGEM2-ES		✓	✓	✓
MPI-M-MPI-ESM-LR		✓	✓	
NCC-NorESM1-M		✓	✓	✓
ICHEC-EC-EARTH		✓	✓	✓

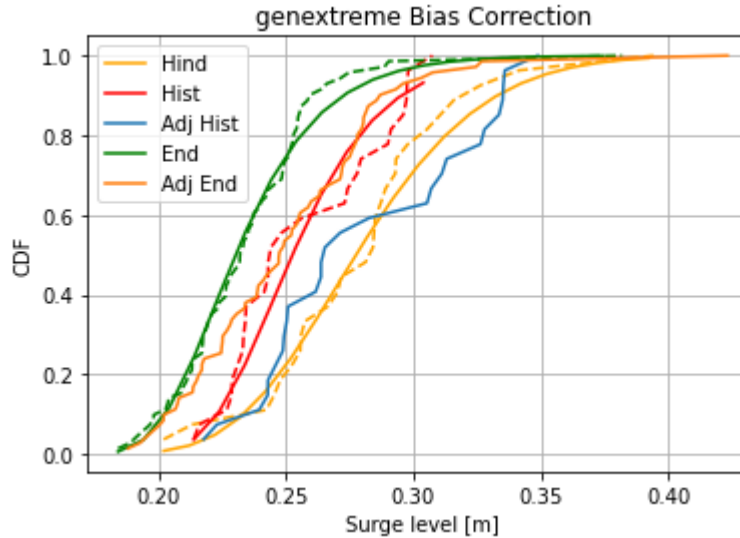

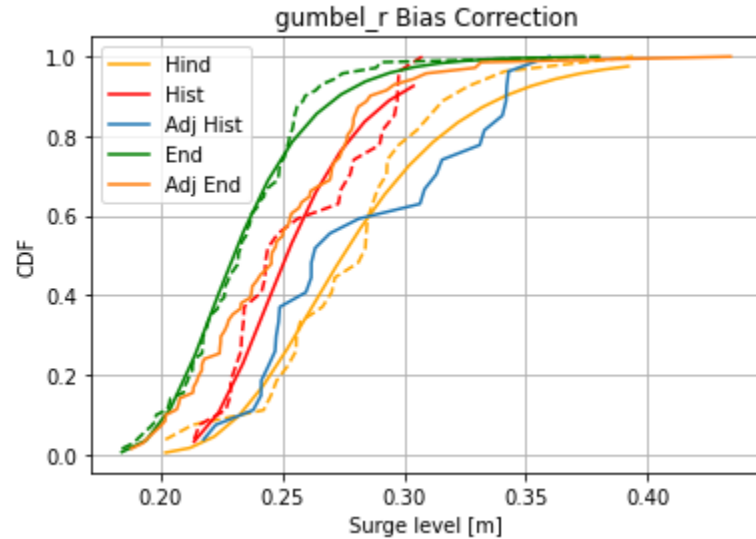

### RCP 8.5

- Baseline - **historical period** (1970-2005)
- **Projection** (2006-2100) → Allow assessment at **mid and end century**.

## Bias Correction of the Annual Maxima

Quantile-mapping approach applied to annual maxima (1979-2005, 27 years):

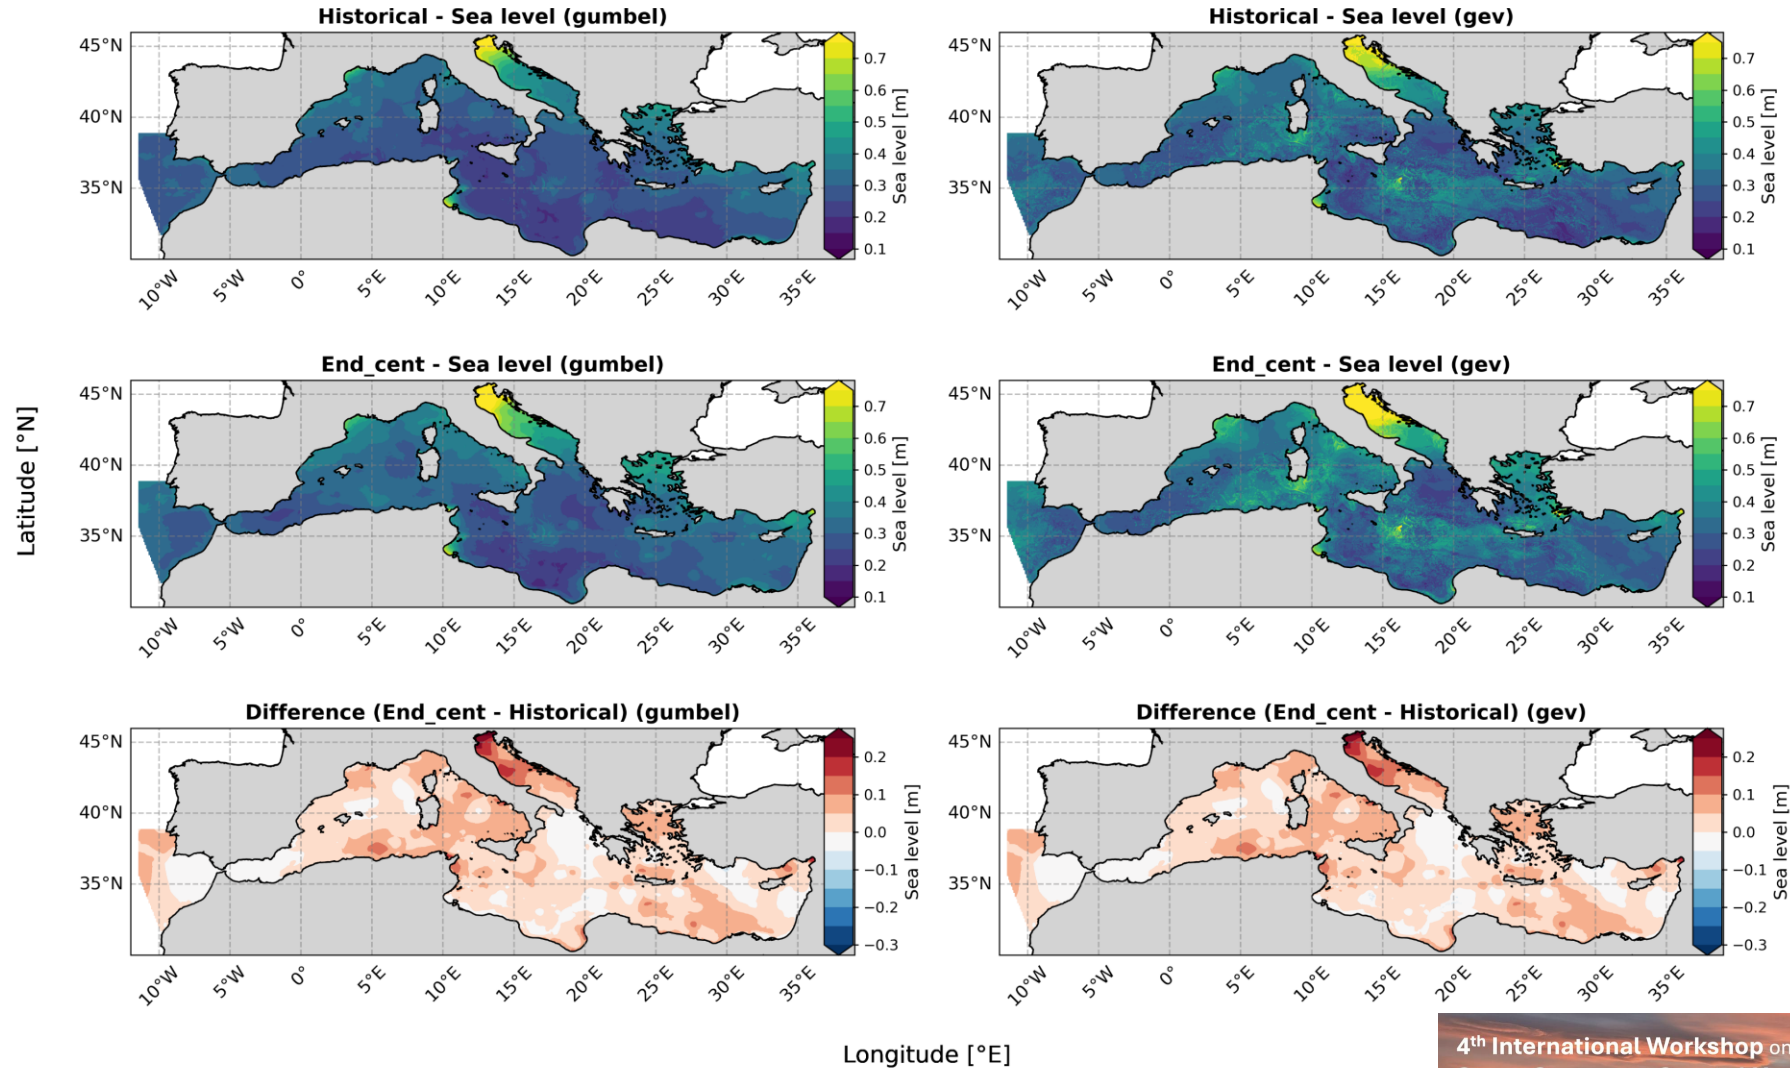

for each grid point, the CDF of the **historical maxima** is **adjusted** to match the CDF of the maxima from the hindcast dataset.

Both **Gumbel** and **GEV** distribution are used.

The same distributional transformation is then applied to the future projections, under the assumption of **bias stationarity**.

# Projections

Being all projections bias-corrected with respect to the hindcast, they are **directly comparable with one another**.

All the projections can be analyzed either **individually** or in a **pooled framework**, the latter providing a **substantially larger sample size for the assessment of extreme events** and a more robust basis for Extreme Value Analysis.

**Difference in surge levels** for return periods of 10, 25, 50, and 100 years between the **hindcast dataset** and the **ensemble of 17 developed projections**.

- To protect coastal communities from the risks associated with extreme storm surge events, it is essential to develop **reliable scenarios** to design **effective adaptation** and **risk reduction strategies**.
- The developed **hindcast** dataset was considered a **reliable reference**, thanks to the validation performed, to assess future variations in storm surge.
- Considered individually, different projections provide varying, sometimes even **contrasting**, information due to intrinsic uncertainty.
- Based on the **ensemble** of the 17 developed projections, **no significant variations** in extreme storm surge events appear in the Mediterranean.

- The aim is to investigate more thoroughly the **influence** that **individual projections** have on the overall results.
- Investigate about the variation in the **frequency** of extreme surge levels.

# Thank you for your attention!
