

Climate Variability of Extremes of Wave Height Using a Time- Dependent GEV Model

Víctor Collado¹, Roberto Mínguez¹, Fernando J. Méndez², Javier Tausia²,
Laura Cagigal², Jared Ortiz-Angulo²

¹Universidad Carlos III de Madrid, ²Universidad de Cantabria

Motivation

- Extreme sea states are critical for design and safety of coastal and offshore infrastructure
- **Significant wave height** (H_s) allows to characterize these conditions
- Climate change, seasonal variability and long-terms trends influence the extremes

Limitations:

- Classical Generalized Extreme Value distribution assumes stationarity

Objectives:

- Apply time-dependent GEV in **5-Day Maxima**
- Gain insights about climate variability of extreme events

Methodology

Time-dependent Generalized Extreme Value distribution:

$$G(x; \mu_t, \psi_t, \xi_t) = \begin{cases} \exp \left\{ - \left[1 + \xi_t \frac{x - \mu_t}{\psi_t} \right]^{-1/\xi_t} \right\}, & \xi_t \neq 0, \\ \exp \left\{ - \exp \left[- \frac{x - \mu_t}{\psi_t} \right] \right\}, & \xi_t = 0, \end{cases}$$

where

$$\begin{aligned} \mu_t &= \beta_0 + \sum_{i=1}^{P_\mu} [\beta_{2i-1}^{harm} \cos(2\pi i t) + \beta_{2i}^{harm} \sin(2\pi i t)] + \beta_{LT} t + \sum_{k=1}^{Q_\mu} \beta_k^{co} n_{k,t} \\ \log(\psi_t) &= \alpha_0 + \sum_{i=1}^{P_\psi} [\alpha_{2i-1}^{harm} \cos(2\pi i t) + \alpha_{2i}^{harm} \sin(2\pi i t)] + \alpha_{LT} t + \sum_{k=1}^{Q_\psi} \alpha_k^{co} n_{k,t} \\ \xi_t &= \gamma_0 + \sum_{i=1}^{P_\xi} [\gamma_{2i-1}^{harm} \cos(2\pi i t) + \gamma_{2i}^{harm} \sin(2\pi i t)] + \gamma_{LT} t + \sum_{k=1}^{Q_\xi} \gamma_k^{co} n_{k,t} \end{aligned}$$

Data

Covariates:

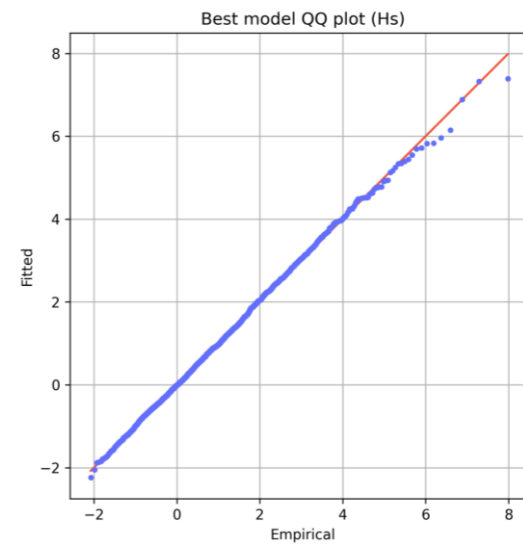

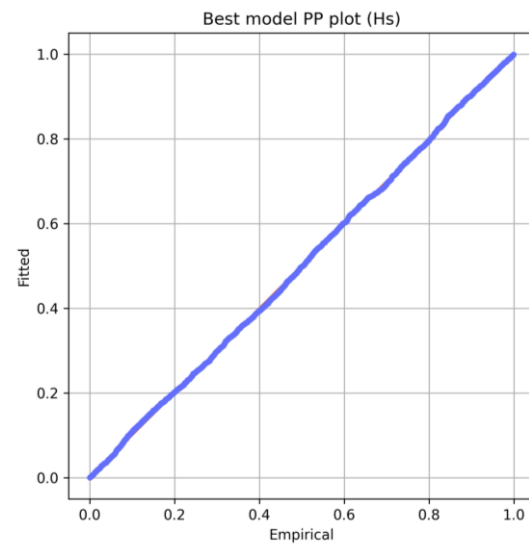

- MSLP
- Gradient of MSLP

Pre-process:

- PCA
- Scale

Results

Results

Results

Conclusions and Future Work

- Climate variability enables the modelling of 5-Day Maxima of significant wave height using a time-dependent GEV model
- Future work: Condition the time-dependent GEV model to Weather Types to obtain physical interpretation of extremes under different climate patterns
- Code available in  **BlueMath**

Climate Variability of Extremes of Wave Height Using a Time-Dependent GEV Model

Víctor Collado¹, Roberto Mínguez¹, Fernando J. Méndez², Javier Tausia², Laura Cagigal², Jared Ortiz-Angulo²

¹Universidad Carlos III de Madrid, ²Universidad de Cantabria

Motivation

- Extreme sea states are critical for design and safety of coastal and offshore infrastructure
- Significant wave height (H_s) allows to characterize these conditions
- Climate change, seasonal variability and long-term trends influence the extremes
- Climate events are time dependent

Limitations:

- Classical Generalized Extreme Value distribution assumes stationarity
- Stationarity may misrepresent risk in climate events

Objectives:

- Introduce time-dependent GEV model
- Apply time-dependent GEV in 5-Day Maxima

Methodology

Time-dependent Generalized Extreme Value distribution:

$$G(x; \mu_t, \psi_t, \xi_t) = \begin{cases} \exp\left\{-\left[1 + \xi_t \frac{x - \mu_t}{\psi_t}\right]^{-1/\xi_t}\right\}, & \xi_t \neq 0, \\ \exp\left\{-\exp\left[-\frac{x - \mu_t}{\psi_t}\right]\right\}, & \xi_t = 0, \end{cases}$$

where

$$\begin{aligned} \mu_t &= \beta_0 + \sum_{i=1}^{P_\mu} [\beta_{2i-1}^{\mu} \cos(2\pi i t) + \beta_{2i}^{\mu} \sin(2\pi i t)] + \beta_{LT} t + \sum_{k=1}^{Q_\mu} \alpha_k^{\mu} n_{k,t} \\ \log(\psi_t) &= \alpha_0 + \sum_{i=1}^{P_\psi} [\alpha_{2i-1}^{\psi} \cos(2\pi i t) + \alpha_{2i}^{\psi} \sin(2\pi i t)] + \alpha_{LT} t + \sum_{k=1}^{Q_\psi} \alpha_k^{\psi} n_{k,t} \\ \xi_t &= \gamma_0 + \sum_{i=1}^{P_\xi} [\gamma_{2i-1}^{\xi} \cos(2\pi i t) + \gamma_{2i}^{\xi} \sin(2\pi i t)] + \gamma_{LT} t + \sum_{k=1}^{Q_\xi} \alpha_k^{\xi} n_{k,t} \end{aligned}$$

and

- P_μ, P_ψ, P_ξ are the sinusoidal harmonics considered
- Q_μ, Q_ψ, Q_ξ are the number of covariates considered
- $n_{k,t}$ is the value of covariate k at time t
- $\beta_0, \alpha_0, \gamma_0$ stationary coefficients
- $\beta_{LT}, \alpha_{LT}, \gamma_{LT}$ long term trend coefficients
- $\beta_{2i-1}^{\mu}, \alpha_{2i-1}^{\psi}, \gamma_{2i-1}^{\xi}$ amplitude of considered harmonics
- $\beta_{2i}^{\mu}, \alpha_{2i}^{\psi}, \gamma_{2i}^{\xi}$ covariate coefficients

Data

Covariates: Mean Sea Level Pressure (MSLP) and its gradient (MSLPG)

Data Pipeline:

Results

Model:

- First 20 PCs for each parameter
- No harmonics, no trends

Diagnostic plots:

Evolution of parameters between 2013-2016

Correlation between PCs and climate indices

Conclusion and Future Work

- Climate variability enables the modelling of 5-Day Maxima of significant wave height using a time-dependent GEV model
- Future work: Condition the time-dependent GEV model to Weather Types to obtain physical interpretation of extremes under different climate patterns
